Telstar's Hot Stamp Interprint Die Station on a MA-P7

The Telstar Interprint Die Station is Servo Driven and bridge mounts above any two print units.

The web travels between stations so that no flexo colors are sacrificed.

Die frames match the dimensions of the parent machine so that all press tooling will interchange.

The Servo Drive features Auto and Re-Register capabilities.

The hot stamp system features a digital touch-screen control unit with recipes for steel, brass, and magnetic dies.

Extensive diagnostics keep the operator informed of all operating parameters. Switchable language and degrees F/C are available from the touch-screen.

A threaded electrical connector and quick disconnect pneumatic fittings enhance change-over times.

Various anvil coverings are available for improved performance on hot stamping, heat sealing, and embossing.
