Offliner™ Web Transport Platform with Rotary Die Cutting

Telstar's "Offliner" Web Transport Platform serves as a means of unwinding with closed-loop tension, steering, and rewinding a web.

It can be constructed for webs from 7" through 20" wide.

The base can be extended to allow for multiple processes.

This Offliner has been configured with Telstar's Rotary Die Cutting Unit that is servo driven with re-register capability.

Die frames can be designed to accept existing tools.

The laminate unwind, matrix pull roller and waste rewind are an integral part of the die station.
