Telstar's Dual Portable Unwind

This mobile unit rolls into position where outboard leveling screws keep it in place. Lateral adjustment of plus- minus 1/2 inch is built into each airshaft.

It is designed to supply rolls between 4" and 24" wide and up to 24" diameter.

The Portable Unwind Unit can be used as a primary unwind to achieve longer runs or to introduce multiple webs to a printing / converting process.

Tension is manually set through a multi-puck brake on each spindle. Putting it to work at press is made easy with a compressed air connection.

The unit can be designed to deliver the left-to-right as shown, or right-to-left per customer request.
