Telstar's Servo Infeed-Nip Solves Multiple Problems

When Telstar installed its Servo Infeed-Nip Unit on the customer's Rotopress, the new retrofit proved to be a single solution to a number of difficult issues. Telstar's unit now holds precise set-point tension within the process zone even during press starts and stops; regardless of roll diameter or unwind tension. Scrap during press starts was reduced to just a few feet instead of several hundred feet while waiting for tension to settle. Plus, the operator no longer needs to reset print register as the unwind roll depletes resulting in overall improvement of print register throughout the run. When presses perform at their peak they produce more profits!
